I. INTRODUCTION

In this project we will study the ground state energy of quantum dots.

II. THEORY

In this project we will study a system of N interacting electrons. We will be looking at a Hamiltonian consisting of a one-body and a two-body part. The one-body part is given by

$$h(\mathbf{r}_i) = -\frac{1}{2}\nabla_i^2 + \frac{1}{2}\omega^2 \mathbf{r}_i^2, \tag{1}$$

where we use natural units $\hbar=c=e=1$ and set the mass to unity. The two-body part is the Coulomb inter-

action potential.

$$v(\mathbf{r}_i, \mathbf{r}_j) = \frac{1}{|\mathbf{r}_i - \mathbf{r}_j|}.$$
 (2)

We thus get the total Hamiltonian

$$H = \sum_{i=1}^{N} h(\mathbf{r}_i) + \sum_{i < j}^{N} v(\mathbf{r}_i, \mathbf{r}_j).$$
 (3)

Next we define the reference Slater determinant as

$$|\Phi_0\rangle \equiv |1, 2, \dots, N\rangle,\tag{4}$$

where $|p\rangle$ are the single particle functions that satisfies the equation

$$h|p\rangle = \varepsilon_p|p\rangle. \tag{5}$$

They are the eigenfunctions to the one-body part of the Hamiltonian and are thus harmonic oscillator functions.

Note that $|\Phi_0\rangle$ consists of the N first occupied single particle functions. We will denote the occupied indices with $i,j,k,l,\dots\in\{1,\dots,N\}$, the virtual states with $a,b,c,d,\dots\in\{N+1,\dots,L\}$ and general indices with $p,q,r,s,\dots\in\{1,\dots,L\}$.
